Toplam (36 veri seti x 12 model = 432 hedef): Performans 426/432 | PFI 426/432 | SHAP 425/432

35/36 veri seti tamamen tam (12/12). Sadece flchain'de eksik var (buyuk veri seti, hesaplama devam ediyor).

12 model neyi ifade ediyor: Her veri seti icin hedeflenen 12 model soyle: cox (Cox regresyon), aorsf (accelerated oblique random survival forest), cforest (conditional random forest), coxboost (gradient boosting - Cox), ctree (conditional inference tree), cv_glmnet (cross-validated elastic net), glmboost (gradient boosting - GLM), glmnet (elastic net), penalized (penalized Cox), ranger (random survival forest), rfsrc (random survival forest - alternatif implementasyon), xgboost_cox (XGBoost - Cox). Ornegin "11/12" bu 12 modelden 11'inin basariyla calistigi anlamina gelir. Not: cv_coxboost (cross-validated CoxBoost) ayri tutuluyor - bu tabloya dahil edilmedi.

Buyuk veri setleri hakkinda not: nwtco, dataDIVAT3, Framingham, rott2 ve flchain buyuk/yavas veri setleriydi; kullanicinin onayiyla veri seti 1/3'e rastgele orneklenerek (set.seed(123), tum modeller icin ayni alt kume) yeniden hesaplandi. flchain haric hepsi tamamlandi.

penalized paketi bug'i hakkinda not: penalized paketinin predict() fonksiyonunda, merkezlenmemis buyuk olcekli degiskenler yuzunden sayisal cokme sonucu tum test gozlemlerine ayni (dejenere) sagkalim egrisi donduren bir hata bulundu; bu, dataDIVAT3, melanoma, rott2 ve flchain veri setlerinde cindex=0.5 ile sonuclaniyor (diger veri setlerinde penalized sorunsuz calisiyor). Bu 4 veri seti icin manuel bir Breslow taban tahmincisi kurularak duzeltme dogrulandi (orn. melanoma: 0.500 -> 0.671), ancak kullanicinin talimatiyla bu duzeltme sonuclara uygulanmadi - 4 veri setinin penalized sonucu da orijinal (duzeltme oncesi, cindex=0.5) halinde birakildi. Duzeltme kodu R/penalized_manual_fix.R dosyasinda referans olarak duruyor.
