Toplam (36 veri seti x 13 model = 468 hedef): Performans 431/468 | PFI 420/468 | SHAP 380/468

13 model neyi ifade ediyor: cox (Cox regresyon), aorsf (accelerated oblique random survival forest), cforest (conditional random forest), coxboost (gradient boosting - Cox), cv_coxboost (cross-validated coxboost), ctree (conditional inference tree), cv_glmnet (cross-validated elastic net), glmboost (gradient boosting - GLM), glmnet (elastic net), penalized (penalized Cox), ranger (random survival forest), rfsrc (random survival forest - alternatif implementasyon), xgboost_cox (XGBoost - Cox). Ornegin "11/13" bu 13 modelden 11'inin basariyla calistigi anlamina gelir.

Not: aorsf ve cv_coxboost modelleri genel olarak birçok veri setinde hic egitilemedi (ayri bir sorun, henuz cozulmedi). nwtco, dataDIVAT3, Framingham, flchain buyuk veri setlerinde SHAP hesaplamasi bellek/sure kisitlari nedeniyle N/m/max_iter parametrelerine dokunulmadan durduruldu.
